University of Glasgow | School of Computing Science

Assessed Coursework

Course Name	**Advanced Operating Systems (M)**			
Coursework Number	**Exercise 2**			
Deadline	**Time:**	**9:00am**	**Date:**	**29 January 2013**
% Contribution to final course mark	**4%**			
Solo or Group ✓	**Solo**	✓	**Group**	
Anticipated Hours	**2**			
Submission Instructions	**Submit via drop-box outside Teaching Office**			
Please Note: This Coursework cannot be Re-Done				

Code of Assessment Rules for Coursework Submission

Deadlines for the submission of coursework which is to be formally assessed will be published in course documentation, and work which is submitted later than the deadline will be subject to penalty as set out below.

The primary grade and secondary band awarded for coursework which is submitted after the published deadline will be calculated as follows:

(i) in respect of work submitted not more than five working days after the deadline
   a. the work will be assessed in the usual way;
   b. the primary grade and secondary band so determined will then be reduced by two secondary bands for each working day (or part of a working day) the work was submitted late.

(ii) work submitted more than five working days after the deadline will be awarded Grade H.

Penalties for late submission of coursework will not be imposed if good cause is established for the late submission. You should submit documents supporting good cause via MyCampus.

Penalty for non-adherence to Submission Instructions is 2 bands

You must complete an "Own Work" form via
https://webapps.dcs.gla.ac.uk/ETHICS for all coursework
UNLESS submitted via Moodle

Advanced Operating Systems (M): Exercise 2

Dr Colin Perkins

22 January 2013

The lectures in the second week of the course introduced scheduling for aperiodic and sporadic tasks in real-time systems. This problem set aims to test understanding of that material, and give practice in determining if a real-time system can be scheduled.

Question 1: Consider a system of three periodic tasks: $T_1 = (3, 1)$, $T_2 = (4, 0.5)$, $T_3 = (10, 2)$. The system must support three aperiodic jobs:

- A_1 is released at time 0.5
- A_2 is released at time 12.25
- A_3 is released at time 17

The aperiodic jobs execute for 0.75 units of time. The system is scheduled using the rate monotonic algorithm, with a simple sporadic server $T_s = (5, 0.5)$ supporting the aperiodic jobs. Simulate the system for sufficient time to show how the aperiodic jobs are scheduled. What is the response time for each of the aperiodic jobs?

Answers must be submitted by 9:00am on 29 January 2013. As per the Code of Assessment policy regarding late submissions, submissions will be accepted for up to 5 working days beyond this due date. Any late submissions will be marked as if submitted on time, yielding a band value between 0 and 22; for each working day the submission is late, the band value will be reduced by 2. Submissions received more than 5 working days after the due date will receive an H (band value of 0).

A drop box will be available for submissions in outside the Teaching Office in Lilybank Gardens, and submissions will only be accepted via that drop box. This problem set is worth 4% of the mark for this course. Ensure that your name and matriculation number are included on each submission, and that you have submitted a statement of originality. Submissions that do not follow these submission instructions will be penalised two bands.
